9.10.3086 [Pro] Unlock code | Grass Valley Edius 9.10.3086 Cracked. Grass Valley Edius 9.10.3086 [Pro] Premium | Grass Valley Edius 9.10.3086 Pro.1. Field of the Invention This invention relates generally to a method and apparatus for developing an electrostatic latent image using the reversal development method, and more particularly to a method and apparatus for continuously monitoring and controlling the reversal development method. 2. Description of the Prior Art In the past, electrostatic latent images have been developed by

utilizing the reversal development method and this method has been widely used in copying machines. In the development of latent images using the reversal development method, a reversal development type roller is used as a developing unit for uniformly applying the developing agent to the latent image carried on the photosensitive medium, and the application rate of the developing agent in the reversal development method is very high. Accordingly, the reversal development type roller is rotated to apply substantially the same amount of developing agent to the

photosensitive medium carrying the latent image. If the developing agent is not applied to the photosensitive medium uniformly, the difference between the amount of developing agent applied to the exposed and unexposed portions of the photosensitive medium appears to vary and the image quality of the developed image deteriorates. Therefore, the application rate of the developing agent in the reversal development method must be accurately controlled. The developing process in the reversal development method is completely reversed from

the reversal development method. Accordingly, the previously known methods of controlling the application rate of the developing agent are not applicable to the reversal development method. A method of developing an electrostatic latent image using the reversal development method is described in U.S. Pat. No. f678ea9f9e
